# Why your design ^{potentially} won't reproduce perfectly.
...Some of your design is missing "trap"

Your design is calling for two or more colours to bump up to each other and "register" perfectly.
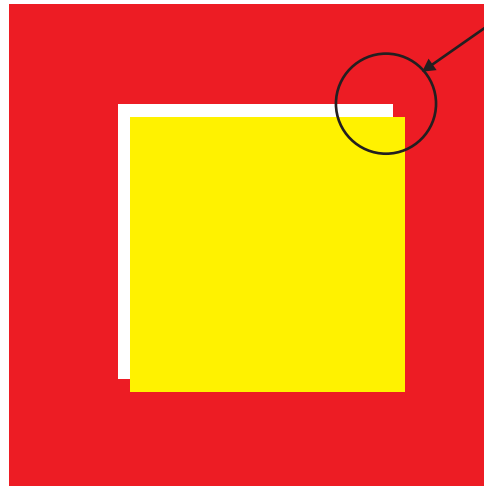

Perfect "registration" of the two colours

Movement exagerated for illustration purposes.

Without "trap" on your yellow box...
if the paper moves even a hair, in the printing press, a hole will appear where the two colours should be touching.
This mis-register will appear sporadically throughout the run
**How do we ensure this won't happen?**

Yellow outline or stroke

"Trap" the yellow box inside the red box...
by applying an outline (or stroke) to the yellow box, and setting this outline to *overprint the fill* then even if the paper moves there will not be a hole in your design.
As a general rule a one point outine will suffice.
